

Top Loading Doorlock pull to open

Description

Door locking system for top loading washing machines with integrated microswitch designed by using a “common basic operating module”, in order to meet any mounting requirement.

Locking and unlocking are done mechanically by a click action simultaneously to the opening and closing of the electrical contacts. It is possible to add a snap switch that in case of failure allows the contacts to remain open and therefore in safe

mode. Fixing is quick and easy because it is done by hand, does not require tools, and is guaranteed for life. The operating section is independent from the mounting section. Reduced dimensions and high safety in the locking system. Low noise when locking or unlocking.

Customizable both for handle and for button opening. Also available with additional microswitch, directly operated by the latch.

Main Benefits

- Meet any new mounting requirement in a short time with reduced investment costs
- Meet any enquiry by adding a module
- Fixing by hand without the use of tools
- “Just in time” deliveries

Certifications

Rold DA Series
